September 2002

Dear Save Set Manager Customer:

In an effort to provide continuously improved storage management software capability to our customers, Compaq offers Compaq Save Set Manager (SSMgr) for OpenVMS VAX™ and Alpha™ Version 1.6 software.

SSMgr is a layered software product that reduces user time spent on save set operations by providing capability for offline save set validation, copy, merge, and support for bound disk volumes. SSMgr therefore improves productivity by reducing backup windows, the number of full backups required, and restore times, without compromising data integrity.

SSMgr for OpenVMS Version 1.6 runs on OpenVMS Versions 6.2, 7.1, 7.2 and 7.3 on the VAX platform, and OpenVMS Versions 6.2, 7.1-2, 7.2-1, 7.2-2, 7.3 and 7.3-1 on the Alpha platform.

The distinct improvement in functionality in SSMgr Version 1.6 over the previous version, is:

— This is the first PCSI SSM kit

— Qualification for the OpenVMS Alpha 7.3-1 release

OpenVMS Version 7.2-2 and 7.3X provide support for Fibre Channel (FC) connected tape devices. This is accomplished through the use of Modular Data Router (MDR) or Network Storage Router (NSR) connected to the FC Switch. Both routers convert Fibre Channel protocol to SCSI protocol, which the attached tape device understands. SSMgr V1.6 has been qualified on Fibre Channel connected devices as outlined/listed in the OpenVMS SPD(s).

Product Support

If you need assistance with this product, please call the Customer Support Center.

Thank you for your purchase of Save Set Manager!

Sincerely,

OpenVMS Product Management CXOSWPM@hp.com
